

### **Breakthrough in Medical Technology Opens the Door to Cure Cancer**

CINCINNATI – Earlier this week at Cincinnati Children’s Hospital, a breakthrough was made in nanotechnology. Researchers were finally able to engineer and program a type of nanomite that can target specific bacterial and viral cells and organisms, leading to the potential to eradicate disease in the modern world, as well as the need for care and treatment of these illnesses. With this new medicinal development, the search for the cure for cancer can really begin in earnest as all focus power and funding can now be channeled in that direction. Who knows, maybe nanotechnology will be the solution to that problem as well.
